Patient Set Up

The Edit Patient Window is where the user will enter the Patients' information. A patient ID is autogenerated but can be changed if a practice uses their own Patient ID system. First the user will enter the patients first name followed by the patients' last name. Date of Birth is an optional field but can be used to determine the patient if a practice has multiple patients with the same first and last name. Patient Notes can be used as well if a practice has multiple patients with the same first and last name.
